The best liquid-tight seal for boreholes in pavements!

The best liquid-tight seal for boreholes in pavements, like concrete or asphalt

The most durable sealing covercap for the soil intermediary! This ECOseals covercap is completely (gas and) liquid tight. Robust, very strong and very easy to install or remove to take. This saves time and convenience. All the drawbacks of the usual street pots have been eliminated. The design and application has been successfully tested for more than 20 years for, among other things, liquid-tight motor fuel locations and a robust industrial environment.

Technical specifications:

- A beautiful, sophisticated and robust closing 120 mm system in metal or strong Glasfiber Polycarbonate
- Suitable for heavy traffic and chemical loads
- The shape of the covercap and mounting means that the covercap is not driven out so that a 100% (gas and) liquid-tight seal is guaranteed
- Very easy to assemble but also quick and easy to open
- Seal is made from Nitrile rubber (NBR)
- Used with great success for more than 20 years for instance at motor fuel locations
- CO2 footprint is a fraction of other resources
- Selected materials can be reused as raw material
- Design therefore meets the circularity requirements of current environmental policy
